

Chapter 4 Problem 48 †

Given

$$F_s = 0.46 \text{ N}$$

$$m_c = 320 \text{ g} = 0.320 \text{ kg}$$

$$a = 0.40 \text{ m/s}^2$$

Solution

Find the mass of the rat.

Since we are on the space station, there is no gravitational force. Therefore, the free-body diagram of the force on the cage and rat is illustrated above. Using Newton's 2nd law gives

$$\Sigma F = ma$$

The only force is that of the scale and the mass consists of both the rat and the cage. Therefore,

$$F_s = (m_c + m_r)a$$

Solving for the mass of the rat gives

$$\frac{F_s}{a} = m_c + m_r$$

$$m_r = \frac{F_s}{a} - m_c$$

Substituting in the provided values gives

$$m_r = \frac{0.46 \text{ N}}{0.40 \text{ m/s}^2} - 0.320 \text{ kg} = 0.830 \text{ kg}$$

Therefore, the mass of the rat is 830 g.
