

## Given

 $\Delta x = 5.4 m$   $\theta = 30^{\circ}$  t = 3.3 s $v_0 = 0 m/s$ 

## Solution

Free-body diagram of the crate.

Find the maximum coefficient of friction that allows the crate to reach the bottom of the ramp in at least  $3.3 \ s.$ 

The slope of the ramp and the coefficient of friction are constant; therefore, the acceleration of the crate down the ramp will also be constant.

Applying the kinematic equations to the problem, find the acceleration of the crate.

$$x = x_0 + v_0 t + \frac{1}{2}at^2$$

Using the initial velocity of 0 m/s and an initial position of 0 m, the acceleration is

$$x = \frac{1}{2}at^{2}$$

$$a = \frac{2x}{t^{2}}$$

$$a = \frac{2(5.4 m)}{(3.3 s)^{2}} = 0.99 m/s^{2}$$

From the free-body diagram given above and using Newton's  $2^{nd}$  law gives

$$\Sigma \vec{F} = m\vec{a}$$
$$\vec{F}_f + \vec{W} + \vec{N} = m\bar{a}$$

Choose the coordinate system so that the x axis is down the ramp. The acceleration will be in the x direction. The weight of the crate in this coordinate system is

 $\vec{W} = mg\sin\theta \hat{i} - mg\cos\theta \hat{j}$ 

<sup>&</sup>lt;sup>†</sup>Problem from Essential University Physics, Wolfson

Writing out Newton's  $2^{nd}$  law in unit vector notation gives

$$-\mu_k N\hat{i} + mg\sin\theta\hat{i} - mg\cos\theta\hat{j} + N\hat{j} = ma\hat{i}$$

The x-component of this equation is

$$-\mu_k N + mg\sin\theta = ma \tag{1}$$

and the y-component of this equation is

$$-mg\cos\theta + N = 0\tag{2}$$

From equation (2) we see that the normal force is  $mg \cos \theta$ . Substitute this into equation(1) and solve for the acceleration.

 $-\mu_k mg \cos \theta + mg \sin \theta = ma$  $\mu_k = \frac{mg \sin \theta - ma}{mg \cos \theta}$  $\mu_k = \tan \theta - \frac{a}{g \cos \theta}$  $\mu_k = \tan(30^\circ) - \frac{0.99 \ m/s^2}{(9.8 \ m/s^2) \cos 30^\circ} = 0.46$ 

Therefore, the coefficient of friction must be less than or equal to 0.46.
