## Chapter 6 Problem $44{ }^{\dagger}$

## Given

$W=7.9 \times 10^{11} \mathrm{~J}$
$m=3.4 \times 10^{6} \mathrm{~kg}$
$\Delta x=180 \mathrm{~km}=1.8 \times 10^{5} \mathrm{~m}$

## Solution

Find the average force as the locomotive pulls the train.
From the definition of work.

$$
W=F \Delta x
$$

Solving for the average force gives

$$
\begin{aligned}
& F=\frac{W}{\Delta x}=\frac{7.9 \times 10^{11} \mathrm{~J}}{1.8 \times 10^{5} \mathrm{~m}}=4.39 \times 10^{6} \mathrm{~N} \\
& F=4.39 M N
\end{aligned}
$$
