

Chapter 6 Problem 23 †

Given

$$k = 200 \text{ N/m}$$

Solution

a) Find the work done to stretch the spring 10 *cm*.

According to the diagram, as the spring is stretched downward, the spring exerts a force in the upward direction. The relationship is as follows.

$$\vec{F}_s = -k\Delta x \hat{j}$$

By Newton's 3rd law the person doing the work must be exerting an equal and opposite force on the spring. Therefore, this force is

$$\vec{F}_p = k\Delta x \hat{j}$$

We find the work that the person did on the spring by using the definition of work.

$$W = \int_0^x F dx = \int_0^x kx dx = \frac{1}{2}kx^2 \Big|_0^x = \frac{1}{2}kx^2$$

The integral definition of work is used because the spring force is constantly changing magnitude. Therefore, to stretch the spring 10 *cm*

$$W = \frac{1}{2}(200 \text{ N/m})(0.10 \text{ m})^2 = 1.0 \text{ J}$$

b) Find the work to go from 10 *cm* to 20 *cm*.

The work to go from 0 *cm* to 20 *cm* is

$$W = \frac{1}{2}(200 \text{ N/m})(0.20 \text{ m})^2 = 4.0 \text{ J}$$

The difference of energy between 10 *cm* and 20 *cm* is

$$\Delta W = W_f - W_i = 4.0 \text{ J} - 1.0 \text{ J} = 3.0 \text{ J}$$
