

Chapter 19 Problem 42 †

Given

Figure 19-23

$$P_1 = 8.000 \text{ atm} = 8.104 \times 10^5 \text{ Pa}$$

$$V_1 = 1.000 \text{ L} = 1.000 \times 10^{-3} \text{ m}^3$$

$$P_2 = 4.000 \text{ atm} = 4.052 \times 10^5 \text{ Pa}$$

$$V_2 = 2.000 \text{ L} = 2.000 \times 10^{-3} \text{ m}^3$$

$$P_3 = 2.050 \text{ atm} = 2.077 \times 10^5 \text{ Pa}$$

$$V_3 = 3.224 \text{ L} = 3.224 \times 10^{-3} \text{ m}^3$$

$$P_4 = 4.100 \text{ atm} = 4.153 \times 10^5 \text{ Pa}$$

$$V_4 = 1.612 \text{ L} = 1.612 \times 10^{-3} \text{ m}^3$$

$$n = 0.20 \text{ mol}$$

Solution

a) Find the heat absorbed.

During the adiabatic processes (in red) no heat is exchanged with the surroundings. During the isothermal expansion (process 1 to 2) heat is absorbed and this is equal to the work since the temperature stays the same. The work done during the isothermal expansion is

$$W = -nRT \ln \left(\frac{V_f}{V_i} \right) \quad (1)$$

From the ideal gas law we know that

$$PV = nRT \quad (2)$$

Replacing nRT in equation 1 with equation 2 gives

$$W = -P_1 V_1 \ln \left(\frac{V_2}{V_1} \right) \quad (3)$$

$$W = -(8.10 \times 10^5 \text{ Pa})(1.0 \times 10^{-3} \text{ m}^3) \ln \left(\frac{2.0 \times 10^{-3} \text{ m}^3}{1.0 \times 10^{-3} \text{ m}^3} \right)$$

$$W = -561.5 \text{ J}$$

From the 1st law of thermodynamics the heat flow in is

$$\Delta Q = \Delta U - W = 0 \text{ J} - (-561.5 \text{ J}) = 561.5 \text{ J}$$

†Problem from Essential University Physics, Wolfson

$$Q_H = 561.5 \text{ J}$$

b) Find the heat rejected.

During the isothermal compression (process 3 to 4) heat is rejected and is equal to the work done on the gas. Using equation 3 we have

$$W = -P_3 V_3 \ln \left(\frac{V_4}{V_3} \right)$$

$$W = -(2.077 \times 10^5 \text{ Pa})(3.224 \times 10^{-3} \text{ m}^3) \ln \left(\frac{1.612 \times 10^{-3} \text{ m}^3}{3.224 \times 10^{-3} \text{ m}^3} \right)$$

$$W = 464.2 \text{ J}$$

From the 1st law of thermodynamics the heat flow in is

$$\Delta Q = \Delta U - W = 0 \text{ J} - 464.2 \text{ J} = -464.2 \text{ J}$$

$$Q_C = 464.2 \text{ J}$$

c) Find the work done.

The work done is the difference between the heat absorbed and the heat rejected. This gives

$$W = Q_H - Q_C = 561.5 \text{ J} - 464.2 \text{ J} = 97.3 \text{ J}$$

d) Find the efficiency of the engine.

Efficiency is given by

$$e = \frac{W}{Q_H} \times 100\% = \frac{97.3 \text{ J}}{561.5 \text{ J}} \times 100\%$$

$$e = 17.3\%$$

e) Find the minimum and maximum temperature.

From the ideal gas law the temperature at 1 is

$$T_1 = \frac{P_1 V_1}{nR} = \frac{(8.104 \times 10^5 \text{ Pa})(1.0 \times 10^{-3} \text{ m}^3)}{(0.20 \text{ mol})(8.31 \text{ J/mol} \cdot \text{K})} = 487.6 \text{ K}$$

The temperature at 3 is

$$T_3 = \frac{P_3 V_3}{nR} = \frac{(2.077 \times 10^5 \text{ Pa})(3.224 \times 10^{-3} \text{ m}^3)}{(0.20 \text{ mol})(8.31 \text{ J/mol} \cdot \text{K})} = 402.9 \text{ K}$$

The Carnot efficiency is then

$$e = \left(1 - \frac{T_C}{T_H} \right) \times 100\% = \left(1 - \frac{402.9 \text{ K}}{487.6 \text{ K}} \right) \times 100\% = 17.4\%$$
